Verifying Application of DirectAccess Settings

1. From a command prompt, type the following command.

   `netsh dns show state`

   ![Command Prompt Output]

   *Direct Access Settings* should show “Configured and …” Enabled if off campus or Disabled if on campus.

   If *Direct Access Settings* shows “Not Configured” you can enter the `gpupdate` command to force the settings to be applied to a qualified computer. This can be done off campus as long as the computer is connected via VPN.

2. DirectAccess Connectivity Assistant

   Once the policy has been applied, the DirectAccess Connectivity Assistant will be installed on the next reboot of the computer.
