Stress Dosing - Oral

During illness and stress, the body automatically increases the production of cortisol to react to the stress/illness so that the body can heal faster. With adrenal insufficiency, however, the body is not able to do this on its own. This then needs to be done artificially by increasing the amount of hydrocortisone you are taking. Stress dosing is given for any of the following reasons:

- Fever 101°F or higher
- Bronchitis
- Diarrhea
- Broken bone
- Vomiting
- Sprain or strain
- Ear infection
- Serious injury/accident
- Strep throat
- Surgical procedure
- Pneumonia
- Immunizations

Stress dosing: Double your cortisol dose for 3 days.

If, for instance, you take the stress dose of pills and vomit within 30 minutes, give the stress dose again.

If you vomit again, you will need to go to the emergency room within 4 hours for medical treatment. Tell the emergency room doctors that you have adrenal insufficiency and what medicine you are taking and at what doses.

If you will be having surgery for any reason, please let the surgeon know before the procedure to discuss the need for stress dosing before, during and after the procedure.

Because illness or injury can be life threatening for persons with adrenal insufficiency, it is important to wear a medical identification bracelet or necklace so emergency personnel know you need special treatment.
