

Additional Information for Clinical Laboratory Science:

Clinical Laboratory Science:

1. The patient's abnormal lab results (lipid profile, glucose and creatinine) need to be followed. Establish a timeline for collecting follow-up samples working with pharmacy and other members of the team.
2. Are the abnormal values only the result of the patient's lack compliance with her medication regimen? Are there any specimen collection issues that may have contributed to the results?
3. How often should lab values be monitored after medication regimen is in place?
4. What additional test(s) would be useful in following up the abnormal creatinine value?
5. How often should Hemoglobin A1c be checked?
