Join Us To Find a Treatment For Alzheimer’s Disease

The ABATE Study is testing an investigational treatment for Alzheimer’s disease in people with Down syndrome.

What Is ABATE?

People with Down syndrome often develop Alzheimer’s disease as they get older. Dementia due to Alzheimer’s occurs when a protein called amyloid builds up in the brain. To fight against Alzheimer’s, the ABATE study aims to answer the following questions.

- If the investigational treatment is safe, and how it works inside the body
- If the investigational treatment helps remove amyloid protein build-ups
- If the investigational treatment slows down memory loss and thinking problems

Who Can Participate?

Those with Down syndrome who are 35-50 years old and have a study partner.

ABATE Study Details

- Participants will be in the study for about 2-years.
- During that time, participants will have to come to the study clinic for about 19 visits.
