

Brain Outcomes and Lifestyle in Down Syndrome Study

KU
MEDICAL
CENTER
The University of Kansas

HELP FIND A CURE

Most people with Down syndrome experience the brain changes of Alzheimer's by the time they are 40 and develop memory problems after the age of 50. Help unlock clues that may lead us closer to a cure.

WHAT WE NEED

We are looking for adults with Down syndrome to join a research study to help us learn how the food someone eats and what they weigh impacts their risk of developing Alzheimer's disease.

WHAT'S REQUIRED

Adults with Down syndrome and a caregiver will be asked to come to the University of Kansas Medical Center.

Researchers will measure how participants' brains work and what they eat.

TIME COMMITMENT

Visits will take 3 hours and can be completed over 2 study visits.

Participants will be compensated for their time and receive a lifestyle report.

BRAIN HEALTH PROGRAM

There will be an opportunity to join our Brain Health in Down Syndrome program. This may help improve our understanding of Alzheimer's and how to prevent it.
